

Two states: booked, and done

Everything between them is invisible — so when a visit goes wrong, the customer becomes the sensor, a free-text box becomes the interface, and a queue becomes the resolution.

MINUTE 32 · THE SCREEN HAS NOT CHANGED

THE ONLY PATH OUT IS A QUEUE

GAP 01

The visit is a black box

There is no state between **booked** and **done**. At minute 3 and minute 45 the screen is identical, so the only way to learn anything is to ask a person.

GAP 02

The customer is the sensor

Nothing is flagged automatically. The customer must notice the delay, classify it, describe it, and then defend it — **for failures the system can already see**.

GAP 03

Support hours ≠ booking hours

Booking is sold as **24/7**. Live chat runs roughly **7 AM – 10 PM**. That leaves nine hours a day where you can book but cannot reach anyone when it fails.

PROMISED ARRIVAL	REPORTED IN REVIEWS	REFUND STATUS	RESOLUTION PATH
15 minutes	40–50 minutes	Not visible	Free text → queue

Self-serve recovery with live visit status

The missing middle: a set of visible states, each with an action attached — so the system detects the failure, and the customer resolves it without ever reaching a human.

FLAGGED BY THE SYSTEM · REFUNDED IN ONE TAP

STRUCTURED CATEGORIES, NOT A PARAGRAPH

FIX 01

The system is the sensor

Every transition is **detected automatically** and stamped. Nobody has to notice it's been 40 minutes. The delay credit lands **before** anyone asks for it.

FIX 02

Checkable, so resolvable

A no-show is a no-show because the **GPS and timestamps say so** — not because a customer describes it convincingly. That removes tickets rather than answering them faster.

FIX 03

A failure handled well builds trust

Visible, flagged, already refunding reads as **"they're on top of this"** rather than "they're unreliable." Same bad outcome, opposite feeling.

ARRIVAL SHOWN AS	VISIT	NO-SHOW REFUND	HUMAN QUEUE
A window, kept honest	Live task checklist	One tap · no ticket	Ambiguous cases only
